1. Introduction

Biggie Chill Spot now has a complete, custom-built Point of Sale (POS) and inventory management system, designed specifically around how the shop operates day to day — retail sales over the counter, wholesale orders in bulk, M-Pesa and cash payments, and full visibility into stock levels at any moment.

This system replaces manual record-keeping with a single, reliable platform that every member of staff — from cashiers to the owner — can use on a computer or tablet, whether at the counter during a busy evening or from the office.

What this means for the business

Every sale is recorded automatically, with stock levels updating in real time.

Owners and admins get an accurate, always-up-to-date picture of revenue, stock, and staff activity.

Cashiers get a fast, simple screen built for speed at the till.

2. What the System Does

The system is organised into six areas, each built around a specific part of running the shop:

2.1 Point of Sale (POS)

A fast, touch-friendly checkout screen where staff search or scan products, build up a sale, and take payment.

- Search by product name, SKU, or scan a barcode directly with a barcode scanner.
- One tap to switch between Retail and Wholesale pricing — wholesale prices apply automatically once the minimum quantity is set for a product.
- Accepts both M-Pesa and Cash payments, with the M-Pesa reference number recorded against every sale for easy reconciliation.
- Generates and prints a proper thermal-style receipt the moment a sale is completed.

2.2 Stock Management

A complete view of everything in the shop, with the tools to keep it accurate.

- Add, edit, or remove products — including retail price, wholesale price, cost price, and low-stock threshold.
- Barcode scanning support when adding new products or receiving deliveries.
- A dedicated "stock take" scan mode: scan a product and immediately adjust its quantity (received, sold outside the system, breakage, etc.), with every adjustment logged.
- Search and filter by category, or by stock level (all / low stock / out of stock).

2.3 Low Stock Alerts

The system watches stock levels continuously and flags anything running low or completely out, so restocking decisions can be made before a product disappears from the shelf mid-sale.

2.4 Dashboard

The first thing anyone sees on logging in — a live snapshot of the day: revenue so far, number of transactions, the split between M-Pesa and cash, retail vs wholesale performance, a 7-day revenue chart, and the best-selling products.

2.5 Reports (Owner & Admin only)

A deeper look at performance over time — daily, weekly, and monthly views of revenue and estimated profit, a full transaction history, and breakdowns by payment method and sale type. Built for reviewing the business, not just the till.

2.6 User & Role Management (Owner & Admin only)

Staff accounts can be created, edited, deactivated, or removed — each assigned a role that determines exactly what they can see and do in the system.

3. User Roles & Access

Every member of staff logs in with their own account. What they can do depends on their assigned role:

Role	Can access	Typical user
Owner	Everything — including Reports and User Management	Business owner
Admin	Everything except owner-only settings — POS, Stock, Alerts, Reports, Users	Shop manager / supervisor
Staff	Point of Sale, Stock (view & adjust), Low Stock Alerts	Cashiers / attendants

This means a cashier can sell and check stock, but can't see revenue reports, edit prices, or manage other staff — keeping sensitive business information restricted to those who need it.

4. Using the System — A Quick Walkthrough

4.1 Logging in

Each staff member logs in with their work email and password. Deactivated accounts cannot log in, so if someone leaves the business, disabling their account instantly cuts off access.

4.2 Making a sale

1. Open Point of Sale from the sidebar.
2. Choose Retail or Wholesale — this decides which prices apply.
3. Search for a product by name, or scan its barcode with a scanner.
4. Adjust quantities in the cart, then tap "Charge".
5. Choose M-Pesa or Cash. For M-Pesa, enter the reference number from the confirmation message once payment is received.
6. Confirm — the sale is saved, stock is deducted automatically, and a receipt can be printed immediately.

4.3 Adjusting stock

From the Stock page, tap the adjust icon on any product, or turn on "Scan to adjust" to scan a barcode and jump straight into the adjustment screen. Choose whether stock is being received, removed, or corrected, enter the quantity, and optionally leave a note (e.g. "Delivery from supplier" or "Breakage").

4.4 Checking on the business

The Dashboard gives an instant read on how the day is going. For a deeper look — trends over the week or month, profit estimates, and full transaction history — Owners and Admins can open Reports.

5. Built for Reliability

Before handover, the system went through a full review of every screen and every backend process to confirm it behaves correctly under real use — stock deductions, payment recording, low-stock detection, and receipt printing were all specifically verified end-to-end. This wasn't a quick build; it was checked line by line before being handed over.

A few examples of what was verified

Every sale correctly reduces stock for each item sold, inside a safe database transaction — so a failed sale never leaves stock in an inconsistent state.

M-Pesa reference numbers entered at checkout are recorded accurately against the sale, so payments can be reconciled against M-Pesa statements.

Low-stock alerts and the dashboard's recent transactions correctly reflect what's actually happening in the shop.

Receipts print reliably every time, with the shop's branding and full sale breakdown.

6. Technical Overview

For reference, and to support anyone who takes over ongoing maintenance in future, here's a short summary of how the system is built:

Layer	Technology
Frontend (what staff see)	React with Vite — fast, modern, works well on desktop and tablet
Backend (business logic)	Node.js with Express — handles sales, stock, users, and reporting
Database	PostgreSQL, managed through Prisma — reliable, structured storage for every product, sale, and user
Authentication	Secure token-based login (JWT) with hashed passwords

This is a standard, widely-used technology stack — meaning the system can be maintained, extended, or handed to another developer in future without being locked into anything unusual or hard to find support for.

7. Getting Started & Next Steps

- Initial staff accounts have been created — please change all default passwords on first login.
- Add your full product catalogue (or confirm the seeded sample data before going live).
- Do a short trial run with a few real sales — retail and wholesale, M-Pesa and cash — to get comfortable with the flow.
- Reach out with any questions, requested changes, or new features once the system is in daily use.

Thank you

Biggie Chill Spot.
